

Indebtedness in Rural India: The Contribution of Cognitive Skills and Personality Traits

Arnaud Natal* & Christophe J. Nordman†

Preliminary draft

June 24, 2021

Abstract

Keywords : Gender, caste,

Introduction

0.0.1 Accroche

Despite the recent economic growth¹ and the improvement in education and health, social disparities subsist in India, especially through the caste system and gender. Historically, caste –or *jāti*, represent an hierarchical and endogamous group of individuals based on occupation. With gender, it represent the major sources of inequality in terms of education (Hasan & Mehta, 2006; Munshi & Rosenzweig, 2006; Saha, 2013), labour (Das, 2012; Madheswaran & Attewell, 2007; Mohanty, 2006), wealth and poverty (Borooah, 2005; Deshpande, 2000; Esteve-Volart, 2004; Zacharias & Vakulabharanam, 2011) or marriage (Banerjee, Duflo, Ghatak, & Lafortune, 2009; Chacko, 2003).

0.0.2 Conditioned individuals through caste and gender with aspirations

More recently, several works highlight disparities between *jāti* and gender in terms of aspirations. Mukherjee (2017) show that “gender and caste primes can significantly affect long run aspirations and beliefs”. Alvi, Ward, Makhija, and Spielman (2019) use priming² to study the effect of identity salience on aspirations. They find that “when women are primed on gender, they exhibit higher aspirations for their daughters [and] low-caste women primed on caste are more aspirational for their daughters”. Finally, Sarkar, Chakravorty, and Lyonette (2020) show that caste and gender work as double jeopardy instead of intersectionality for aspirations. Indeed, “the most socially disadvantaged groups – Scheduled Tribe (ST) and Scheduled Caste (SC) – have significantly lower income aspiration when compared to Other Backward Class (OBC) and Other Caste (OC) participants” [and] [f]emale participants also have significantly lower aspiration than their male counterparts”. Moreover, SC/ST female participants have lower income aspiration levels compared to other groups. Thus, beyond being a source of

²Priming, in cognitive psychology, is “the effect in which recent experience of a stimulus facilitates or inhibits later processing of the same or a similar stimulus.” – <https://dictionary.apa.org/priming>. Accessed June 21, 2021.

inequality, *jāti* and gender seems to deeply impact individuals by conditioning them. More than an fragmentation and more than sources of disparities, caste and gender seems to deeply impact social identities of individuals in India. Indeed, it seems to conditionned individuals, it is part of their identity that affect action deep inside them as determine their aspirations. In this context it appears important to analyse the role of personality traits & cognitive skills on debt in take into account the deepness of this social identity.

Aspirations limitée par notre caste et notre sexe.

0.1 Debt

Less work try to understand this disparities in terms of debt while it is an important research topic.

0.1.1 Incidence of debt with disparities

The Indian context is unique in terms of household finance (Badarinza, Balasubramanian, & Ramadorai, 2016).

% HH concerned and amount with NSSO (2014) The largest part of households debt is informal in rural India (Badarinza et al., 2016).

- car les terres et les maisons s'héritent : (Badarinza et al., 2016) avancent que cela peut provenir de la « prédominance des ménages multigénérationnels, dans lesquels les terres et les propriétés résidentielles constituent une part importante des legs » donc pas beaucoup besoin d'emprunt formel. 4% des ménages dont le chef a moins de 35 ans ont un prêt hypothécaire ce qui est nettement inférieur à la situation des autres pays émergents comme la Chine (Badarinza et al., 2016).
- Pénétration bancaire très hétérogène : (Badarinza et al., 2016) et (Burgess, Wong, & Pande, 2005) : les États ayant un taux de pénétration bancaire élevé sont ceux où les ménages sont les moins dépendants de l'endettement non institutionnel.

Paysage financier de Guérin, Roesch, Michiels, and Venkatasubramanian (2012) for informal debt and reasons of debt: beaucoup de cérémonies, beaucoup de survie quotidienne.

OK, on voit que beaucoup de monde est concernés, avec tel montant, tel type de dette et telle raison, mais many disparities. Disparities

- Guérin, D'Espallier, and Venkatasubramanian (2013) show that caste affect borrowing strategies as amount, type and source of debt in rural India. Moreover, they show that debt is a "social transaction which inscribes debtors and creditors into local system of hierarchies".
- Reboul, Guérin, and Nordman (2021) find an interest in the gender perspective.
- Debt bondage for dalits (Guérin & Venkatasubramanian, 2020)
- The case of microfinance for womens (Guérin, Michiels, Nordman, Reboul, & Venkatasubramanian, 2020)
- Castes, sex, moc, etc. (Guérin et al., 2012) (Guérin et al., 2013) (Guérin, 2014) (Reboul et al., 2021)

0.1.2 Individual debt and public policies

- Financial inclusion : more and more HH are financial included (Badarinza, Balasubramaniam, & Ramadorai, 2019), especially in India (Chakravartya & Pal, 2013). **Literature Isabelle**

- Secondly, on a vue que quasi tout le monde est concernés par la dette et especially to consume which is an determinants of global wealth (expenditures approach of GDP). In India, the households and non-profit institutions serving households (NPISHs) final consumption expenditure represent 60.29% of GDP³.
- Household finance has faced a renewed interest since a decade (Guiso & Sodini, 2013). Indeed, household are more implicated in financial decision such as privatization of retirement pension, liberalization of loan market, increase in credit purchase, which are more complicated because of financial innovation⁴.

0.1.3 Debt is not just money, it is social link

- Question de la confiance très présente dans la dette : Guérin, Roesch, Venkatasubramanian, and Kumar (2014) Households' creditworthiness is above all a matter of trust (nambikai), the term used locally when people refer to their ability to access credit. The fabric of trust covers many aspects that far exceed good credit history and repayment behaviour, and relates to every aspect of the borrowers' reputation. Creditworthiness is rarely assessed on the individual level, and often incorporates the reputation and morality of the whole family or even lineage (Harriss-White and Colatei 2004). Lenders often state that they take two levels into account. One relates to family and lineage (taradaram), namely the family's history, its "ethical" background and "morality". The second level is individual (daram), relating very broadly to the "quality" of a person. It is therefore perfectly rational that the poor attach an equal importance to their reputation.

"Behavior" also matters. As previously discussed, low castes are often seen as risky borrowers. Irrespective of caste, bad habits such as laziness, alcoholism and gambling are considered as indicators of poor repayment potential. As discussed above, respect and deference are also highly valued. Potential borrowers should equally show respect to their lenders and at times to its community. Giving money is a matter of respect. I respect them, they should respect me. How could I give them money if they talk badly about me? (Rajagopalan, Reddiar [FC], landowner and lender). If you don't want credit from a particular community, then you can talk about them to others; otherwise you should not criticize. It might spoil creditworthiness. We should talk respectfully about these people, this is the only way to get creditworthiness (Gundusammy, Goundar (MBC), agriculture coolie and marginal farmer).

- Rapport de force Guérin (2014)
(Guérin & Venkatasubramanian, 2020) inseparable from an overall set of interdependencies, protection and social differentiation
- Social and moral experience imbued with subjectivities, felt-obligations and also aspirations
- Prestige sociale Guérin et al. (2014) To understand debt practices, motivations and rationales, however, it is necessary to examine how the poor perceive and experience debt. It also requires taking into account the diversity of debt meanings and debt relationships. Of those in extremely vulnerable financial situations, very few consider themselves as over-indebted. The contrast between exogenous categorisations and local subjectivities is striking. One could of course argue that the poor suffer from "false consciousness", in the sense that they are not even able to assess their own exploitation. Our explanation is

³World Bank Data – <https://data.worldbank.org/indicator/NE.CON.PRVT.ZS?locations=IN>. Accessed January 22, 2021.

⁴For a comprehensive review on the subject, see Tufano (2003).

different: we argue that the poor have their own “frameworks of calculations” (Villarreal 2009; this volume) and debt hierarchies (Shipton 2007). Such phenomena transcend questions of material or self-centred motivations and reflect issues of status, honour, power, and individual and group identity. This is our second argument: individuals engage multiple criteria to establish debt hierarchies and to evaluate debt burdens. Though financial criteria certainly matter, the social meaning of debt is equally, or more valued. While some debts are dishonoring, others are not. This depends upon the social relation between the debtor and the creditor and their respective status. Caste, class, kin and gender relationships are instrumental here.

Guérin (2014) Firstly, the social meaning of debt clearly matters. Debt is a marker of social hierarchy in kinship groups, the neighborhood and community alike. People try to avoid debts degrading to their status, or at least try to pay back these debts first.

Guérin et al. (2014) : What is however clear is that over-indebtedness as a concept has little meaning to the poor. Financial indicators are certainly useful (and will be used here) to quantify the cost of debt.

0.2 Cognitive skills

0.2.1 Accroche avec les insitutions et les défintions

The Big-Five model –or Five Factor model (FFM)– constitute the main personality trait taxonomy. Based on Goldberg (1981) and McCrae and Costa (1987) works, this taxonomy identify five dimensions of personality from factor analysis [on specific questionnaires]: neuroticism (i), *i.e.* the capacity to experience negative emotions (anxiety, anger, depression, etc); extraversion (ii), *i.e.* the energy, the capacity to experience positive emotions, the tendency to seek stimulation and company from others; openness to experience (iii), *i.e.* “one’s capacity to be creative and unstructured versus one’s tendency to need structure and clarity” (Piedmont, 2014); agreeableness (iv), *i.e.* “perceptions of others that are caring, compassionate, and altruistic versus manipulative, self-serving, and antagonistic” (Piedmont, 2014); conscientiousness (v), *i.e.* the capacity to display self-discipline, act dutifully, and strive for achievement against measures or outside expectations.

0.2.2 Cognitive skills in economics

Since a decade, intrinsic differentiation of individual through cognitive skills and personality traits is increasingly examining by researchers and institutions. Almlund, Duckworth, Heckman, and Kautz (2011) for comprehensive review, but explain output on labor, education, crime. Labor market:

- 1 les différences de rémunérations (Bowles, Gintis, & Osborne, 2001) (Heckman, Stixrud, & Urzua, 2006) (Cawley, Heckman, & Vytlačil, 2001)
- 2 performance au travail : la consciensiocité est le trait qui prédit le mieux la performance au travail de facon générale: (Nyhus & Pons, 2005) (Salgado, 1997) (Hogan & Holland, 2003) (Barrick & Mount, 1991)
- 3 type de travail : À la différence du quotient intellectuel (Q.I.), ce trait de personnalité ne varie pas avec la complexité du travail effectué, laissant penser que la conscienciosité concerne un plus large éventail d’emplois. En effet, les professeurs, les scientifiques et les cadres supérieurs ont en général de meilleurs résultats en matière de compétences cognitives par rapport à des travailleurs non qualifiés (Schmidt & Hunter, 2004) (Almlund et al., 2011) (Barrick & Mount, 1991). + (Cobb-Clark & Tan, 2011) trouvent que le degré

d'agréabilité a une relation négative avec la probabilité d'être un manager et d'être un professionnel des affaires (business professional).

Education: On regarde aussi l'éducation où [Almlund et al. \(2011\)](#) : Avant tout, les auteurs constatent que parmi les cinq (5) traits du Big Five, la conscienciosité et le névrosisme prédisent bien un grand nombre d'outcomes, notamment ceux en rapport avec l'éducation (la conscienciosité explique assez bien l'attainment et achievement à l'école). L'ouverture à l'expérience prédit, elle, assez bien la course difficulty selected et l'attendance.

Santé: Lorsque les variables expliquées sont en rapport avec la santé, la conscienciosité est le meilleur prédicateur pour la longévité de vie (plus que l'intelligence et le background) ([Almlund et al., 2011](#))

Crime: Enfin, lorsque les auteurs s'intéressent à la littérature sur la criminalité, ces derniers relèvent que la conscienciosité et l'agréabilité sont d'importants prédicteurs de la criminalité ([Almlund et al., 2011](#))

0.2.3 Skills and debt

Few researcher have been interested in the relationship with household finances while "it is apparent that personality traits may influence financial decision-making at the individual and household level" ([Brown & Taylor, 2014](#)).

Mais quelques travaux sur financial literacy qui lie un peu les la dette et les skills ([Hastings, Madrian, & Skimmyhorn, 2013](#)) ([Varum, 2014](#)) ([Pinjisakikool, 2017a](#)) ([Gaurav & Singh, 2012](#)) ([Hastings et al., 2013](#))

Les premiers travaux qui lie skills et hh finance ont moins de 10 ans et s'intéressent principalement à:

- 1 décision d'investissement, financial distress : ([Nga & Yien, 2013](#)) ([Pinjisakikool, 2017b](#)) ([Buccioli & Zarri, 2017](#)) ([Agarwal & Mazumder, 2013](#)) ([Parise & Peijnenburg, 2019](#))
- 2 épargne : ([Cobb-Clark, Kassenboehmer, & Sinning, 2016](#)) ([Gerhard, Gladstone, & Hoffmann, 2018](#))
- 3 dette : ([Forlicz & Rólczyński, 2019](#)) ([Silva et al., 2018](#)) ([Brown & Taylor, 2014](#))

0.3 Topic relevance

Dans un environnement contraint par sa caste et son sexe, est-ce que les individus arrivent à se distinguer par leur personnalité en termes de dette ?

C'est d'autant plus intéressant que la dette est omniprésente [Guérin, Michiels, Natal, Norman, and Venkatasubramanian \(2020\)](#); ?

Try to capture the role of cognitive skills and personality traits thus allows to better understand the determinants of indebtedness in India, which is an important vector of wealth through consumption.

The main objective of this paper is to analyse the role of cognitive skills and personality traits on indebtedness in a context where contextual determinants variable are decisive.

1. à travers ce papier on cherche tout d'abord à mieux comprendre l'endettement
2. puis on cherche à concilier deux gros pan de la littérature: structurel vs individualiste

1 Data and methodology

1.1 Data

Our empirical analysis is based on the NEEMSIS-1 & NEEMSIS-2 (Networks, Employment, dEbt, Mobilities and Skills in India Survey) surveys carried out respectively in 2016-17, and 2020-21 ([Nordman, Guérin, Michiels, Natal, & Venkatasubramanian, 2019](#); [Nordman et al., 2017](#)). This survey was the second and third waves of a longitudinal data collection project start in 2010 with RUME (RUral Microfinance and Employment survey) project in ten villages of Tamil Nadu. Located in the Cuddalore and Villupuram districts, a mostly agricultural area, economies benefits from the proximity of two large industrial towns (Neyveli and Cuddalore) and a regional business center (Panruti).

RUME randomly selected 405 households using stratified sample framework based on three dimensions: proximity to small towns (Panruti, Villupuram and Cuddalore), an agro-ecological criterion, and caste affiliation. Thus, half of villages are irrigated (the other half have dry lands) and within villages, half of the sample was selected from the mostly upper and middle caste part of the village (Ur) while the other half from the Colony part, where dalits (the ex-untouchables) mainly live. NEEMSIS1 recovered 388 households (4.19% attrition rate) and randomly selected 104 news households (for a total of 492 households) from these 10 villages, based on the same method. NEEMSIS2 recovered 485 households (1.42% attrition rate) from 2016-17 and recovered 10 households from 2010 that were not recovered in 2016-17. Moreover, 100 news households were randomly selected (for a total of 595 households).

In NEEMSIS1 & NEEMSIS2, two household members, called “ego 1” (mostly household questionnaire respondent) and “ego 2” (one younger household member randomly selected on a criterion of age), are directly addressed individual questionnaires that provide for instance a range of information on cognitive skills and personality traits.

NEEMSIS’s surveys stands out from other Indian data sources such as the All India Debt and Investment Survey (AIDIS), as it has the rare and valuable advantage of recording debt at the individual level (identifying the person who went to the lender and borrowed in her own name).

Concerning the reliability, the great expertise of the team⁵, helped to formulate questions appropriately. This for instance involved using particular terms that are less degrading than the generic term “debt” lists of the main local lenders, and asking indirect questions. As stated by [Reboul et al. \(2021\)](#) (same data sets) “[i]mproved data accuracy is for example reflected by an incidence of indebtedness found higher than in the estimates of the nation-wide AIDIS: 99% of households are in debt in our case study, as opposed to 30% in rural Tamil Nadu in 2012 according to the AIDIS ([NSSO, 2014](#)).”

Moreover, the moderate magnitude of the survey, compared to nationally representative datasets, ensures the high quality of the data and the tablet-based mode of data collection improved data quality in including constraints on answers to prevent inconsistencies.

Our final sample consists of 473 households and 835 egos because in 2016-17, two households does not have egos; and for 10 households all egos have changed between 2016-17 and 2020-21 (see Appendix A).

1.2 Construction of personality traits & cognitive skills variables

As stated earlier, our survey allow us to construct Big-5 personality traits. On the basis of 35 questions relatives to Big-5 taxonomy, we averaged answers –based on a Likert scale from 1-“Almost Never” to 5-“Almost always”, that belong to a determined trait after correcting for

⁵Some members of the research team are present since more than twenty-year on the region for numerous quantitative and qualitative surveys.

acquiescence bias⁶ (see Appendix B). The resulting mean represent the score on each traits.

McDonald's ω ⁷, a measure of internal consistency, are mostly satisfactory: 0.81 for openness; 0.86 for conscientiousness; 0.59 for extraversion; 0.60 for agreeableness and 0.80 for emotional stability.

Cognitive skills include three score variables: literacy, numeracy, Raven⁸. These scores are construct in adding up the correct answers of a set of four questions for literacy and numeracy test and 36 for Raven.

Exogeneity The exogeneity of personality traits is well assume because of stability over time while there is no consensus in psychology (Ardelt, 2000).

According to Costa and McCrae (1997); McCrae et al. (2000) it remains stable, in part, because it is a genetic predisposition that, by definition, cannot be changed over life. Economist follow this path and the majority of then assume stability over time after the age of 25 and other verify this stability (Cobb-Clark & Tan, 2011).

This stability refutes sociological and psychological literature which interesting in the influence of childhood and adulthood socialization on personality (Moen, Elder Jr., & Lüscher, 1995; Mortimer & Simmons, 1978). Following this path, Ardel (2000) state that "personality can change over the course of a person's life, particularly if age at first measurement is low or over 50, if the retest interval is large, if individual personality aspects rather than the overall personality are considered, and if personality aspects other than the big five NEO traits are assessed."

Our data allow us to examine stability over time of Big-5 personality traits for 835 individuals of rural India. Calculating variation rate between 2016-17 and 2020-21 of each traits, results show a stability for minor part of the population (see Table 1).

Thus, in order to limit endogeneity –through reverse causality, we investigate the role of personality traits and cognitive skills (and all others independents variables) in 2016-17 on 2020-21 debt.

Factor analysis As warned by Laajaj et al. (2019), the Big-Five taxonomy is limited in developing countries for several reasons: the enumerator-respondent interactions (i) in face-to-face survey can induce a bias; the low education levels (ii) can make questions more difficult to understand and can induce a systematic response patterns, especially the acquiescence bias (iii).

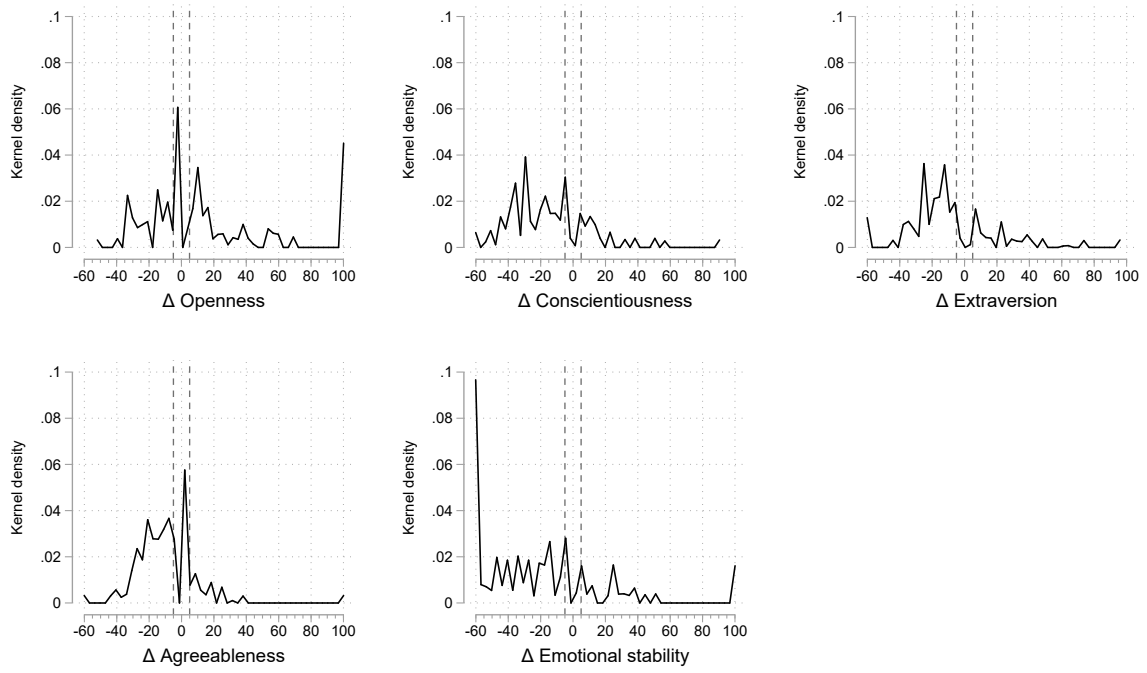

The very good knowledge of the field allow us to collect data of high quality and avoid a bias due to misunderstanding of questions. Moreover, we implement our own factor analysis of the 41 questions by principal component with promax rotation. To avoid a bias in factor analysis, we do not corrected for acquiescence bias. In our dataset, acquiescence bias is measure with a set of inverse questions that are supposed to measure the same aspect of personality. This assumption is true only in the context of Big-5 model. In another context, the questions can, perhaps, have a different meaning.

The resulting factors are relatively similar to the Big-5 personality traits (see Appendix B) with satisfactory McDonald's ω : Factor 1 as Extraversion-Openness ($\omega = 0.91$); Factor 2 as Conscientiousness ($\omega = 0.87$); Factor 3 as Emotional stability-Conscientiousness ($\omega = 0.76$); Factor 4 as Emotional stability ($\omega = 0.81$) and Factor 5 as Agreeableness ($\omega = 0.64$).

⁶Acquiescence bias represent the "tendency for survey respondents to agree with statements regardless of their content" (Lavrakas, 2008).

⁷Literature on internal consistency estimators increasingly agrees that Cronbach's α –the most wide used estimator, is maybe not very efficient (Bourque, Doucet, LeBlanc, Dupuis, & Nadeau, 2019; Trizano-Hermosilla & Alvarado, 2016).

⁸Raven test is "a nonverbal test of mental ability consisting of abstract designs, each of which is missing one part. The participant chooses the missing component from several alternatives to complete each design." – <https://dictionary.apa.org/ravens-progressive-matrices>. Accessed January 27, 2021.

Kernel: Epanechnikov;
 Bandwidth: 0.1;
 All traits are corrected from acquiescence bias.

Figure 1: Stability over time of Big-5 personality traits – Distribution of variation rate between 2016-17 and 2020-21 for Big-5 personality traits corrected from acquiescence bias for 835 individuals from rural Tamil Nadu, India.

Source: NEEMSIS-1 (2016-17) & NEEMSIS-2 (2020-21); author's calculations.

Life-cycle effects To mitigate against the potential problem of life-cycle events –that might induce endogeneity through measurement error, we run univariate OLS regression with cognitive skills and personality traits as endogenous variables and age as exogenous variable (see Appendix B). We standardised the resulting residuals and use it as cognitive and personality measures net of life cycle influences (Brown & Taylor, 2014; Nyhus & Pons, 2005).

1.3 Indebtedness measures

Before exploring the role of cognitive skills and personality traits, it is necessary to discuss debt and over-indebtedness measures. There is no consensus in the literature but three approaches are often retained (Betti, Dourmashkin, Rossi, & Yin, 2007; Ferreira, 2000). Objective measures focus on the ability (or inability) to service or repay debts. Typically, it is the debt to income ratio, debt to asset ratio, debt service ratio. Over-indebtedness occurs when a certain threshold is exceeded. Although this is the most widely used measure, it under-estimate the burden of debt in ousting personal feeling and sacrifice associated with debt and over-indebtedness (Betti et al., 2007).

Subjectives measure assume that “individual households are the best judges of their own net debt/wealth position” (Betti et al., 2007). The robustness of the results are based on the degree of honesty and literacy of individuals that can make it, sometimes, less reliable (Betti et al., 2007; D’Alessio & Iezzi, 2013). As stated by Rinaldi and Sanchis-Arellano (2006) and Keese (2012), in general, objective measures align quite well with subjective measures at the household classification level.

Administrative measures treat indebtedness and over-indebtedness as “all cases where non-payment of debts have been registered officially or declared before a court” (Betti et al., 2007). In rural Indian context, this type of measures have little meaning since most of the debt is informal.

In order to best measure the debt, we could combine objective and subjective measures as Aniola and Golas (2012) do in European Countries, but this brings the risk that all households will find themselves categorized as over-indebted according to the measure used (Chichaibelu & Waibel, 2018).

It is recommended to analyse indebtedness at household level because generally income is grouped between household members (Fondeville, Ozdemir, & Ward, 2010). However, in order to explore the role of individual characteristics such as personality and cognitive skills on indebtedness, we focus on three types of individual objective measures allowing us to understand the debt from three angles.

First, we wish to understand the role of personality traits & cognitive skills on the incidence of individual debt –through the probability of being in debt⁹ in 2020-21.

Second, we investigate the size/breadth of the individual debt through an absolut and a relative objective measure of debt. We use the total amount of individual debt taken out in her own name and the number of loans taken by an individual as absolut measure of debt. Our relative measure of debt is the individual debt service ratio¹⁰. Then, to measure over-indebtedness, we dichotomize IDSR at 0.4 and 0.5 threshold. An individual is considered to be over-indebted when it is annual debt represent more than 40-50% of his annual income (Chichaibelu & Waibel, 2017; D’Alessio & Iezzi, 2013).

1.4 Econometric framework

Selected sample In order to understand the relationship between personality traits & cognitive skills in t and indebtedness situation in $t+1$ in a constraint environnement and to deal with sample

⁹Dummy variable equal to 1 if the individual has some unsettled debt taken out in her own name, 0 otherwise.

¹⁰ $\frac{\text{Individual Debt service}}{\text{Individual Annual Income}}$ which represent the share of income required to cover the repayment of interest and principal on a debt for one year.

size issue and with constraint environment (through caste and gender), we use interaction variable strategy. Although the best strategy is to use sub-sample (allow different coefficient for all variables), we use interactions variables to satisfy the assumption of $N \rightarrow +\infty$.

Data structure and clustering As mention earlier, in our data, individual questionnaire concerned two individuals “egos” of each household. In analyzing debt at individual scale here, we investigate the role of personality traits & cognitive skills for all “egos”. **Cluster car plusieurs indiv par HH = non indépendants en stat et dans la lit avec allocation of ressources:** Question of the allocation of ressources within household is, obviously, essential in this configuration. Indeed, (Lazear & Michael, 1988) (Bonke, 2015) We find that in most households the income distribution is correlated with the sharing of consumption—the economic approach—and that this holds true even if the household pools its resources—the economic psychology approach, implying that there is no strong relationship between the two approaches.

Thus, we clustered error by households to take into account the fact that observations within each household are not independently and identically distributed.

Estimators see Table 1 First, to estimates dummy variables, we use probit modele with maximum likelihood (ML) estimation and we clusterize the error at household level. Same estimator for over-indebtedness because dummy variable too.

$$P(Y = 1|x) = \phi(\beta_0 + X'_1\beta_1) \quad (1)$$

To estimates the total loan amount, we use OLS with cluster at household level and not use tobit model because our data are not censored or truncated, but defined on \mathbb{R}^+ (Maddala, 1991). For IDSR, we also use OLS with cluster at household level and not GLM because of the upper bound of the variable ($+\infty$ and not 1).

$$Y_i = \alpha + X'_i\beta + Z'_i\gamma + \epsilon_i \quad (2)$$

Last, for count data as the number of loans, we use Poisson regression.

$$P(Y = y) = \frac{e^{-\lambda}\lambda^y}{y!} \quad (3)$$

Table 1: Summary of specifications

Code	Specifications	In debt (=1)	Loan amount	Number of loans	IDSR	Over-indebtedness (=1)
(1)	All controls	X	X	X	X	X
(2)	+ PTCS X Gender [†]	X	X	X	X	X
(3)	+ PTCS X Caste [‡]	X	X	X	X	X
(4)	+ PTCS X Gender X Caste [§]	X	X	X	X	X
Estimator		Probit	OLS	Poisson	OLS	Probit
Interpretation		M.E.	M.E.	M.E.	M.E.	M.E.
Number of individuals		835	606	606	606	606
Description of individuals		All egos	All indebted egos	All indebted egos	All indebted egos	All indebted egos

Note: [†]Two-way interaction terms allow us to separate M.E. between sex, which mean that we obtains two columns: male and female. [‡]Two-way interaction terms allow us to separate M.E. between caste, which mean that we obtains two columns: dalits and middle-upper caste. [§]Three-way interaction terms allow us to separate M.E. between gender and caste, which mean that we obtains four columns: muc male, dalits male, muc female and dalits female.

Source: NEEMSIS-1 (2016-17) and NEEMSIS-2 (2020-21).

Control variables Our control variables are based on Brown and Taylor (2014); Chichaibelu and Waibel (2017); Reboul et al. (2021) which take the existing classic controls. We use two

vector of variables in 2016-17.

One at individual level, includes: age; age square; dummy variable which take 1 if individual is the household head, 0 otherwise; main occupation¹¹; number of occupation (dummy variable if plusieurs occupations plutôt); dummy variable which take 1 if individual received formal education through school, 0 otherwise (no formal education) and a dummy variable for marital status (1 if married, 0 otherwise). And households controls:

One at household level, includes: monetary value of assets¹²; sex ratio; annual income; household size; number of children (individual under 16 years old); shock exposure (dummy variable which take 1 if the household experienced a shock¹³ between 2010 and 2016-17, 0 if not); number of income sources. Finally, we added villages fixed effects.

¹¹Define as the most time-consuming activity.

¹²The monetary value of assets includes the monetary value of gold; land; house; livestock; agricultural equipment and consumption good such as car, computer, cookgas, phone, etc.

¹³Marriage of at least one of the household members or/and household surveyed after the demonetisation.

2 Descriptive statistics

2.1 Study population

Household unit in Table 2 Our final sample consists of 835 individuals from 473 households and almost half are dalits. Three quarters of households have 2 egos, the last quarters have only one egos. The sex ratio is significantly different through caste: in 24% of dalits households there are as many men as women while in middle-upper caste, it is 34% of households. In terms of assets, middle-upper caste households are three times richer than dalits on average –respectively 1,493,350 INR and 487,420 INR. 50% of middle-upper caste have less than 666,500 INR of assets while 50% of dalits households have less than 266,400 INR. This economic advantage is also found with income: the median income of middle-upper caste is 33.71% higher than dalits one (respectively 142,200 INR and 106,350 INR). We do not find difference in terms of shock and indebtedness between caste: 57% of households faced a shock between 2016-17 and 2020-21 and 99% of households have at least one outstanding loan.

Source: NEEMSIS-1 (2016-17); author's calculations.

Individual unit in Table 3 At egos scale, 22% of our sample are dalits female, 26% are dalits male, 22% are middle-upper caste female and 30% are middle-upper caste male. Dalits women

are, on average, the youngest (39 years old) and middle-upper caste male are the oldest (45 years old). Three quarters of male are the head of household while female are only 9%. In terms of education, middle-upper caste are more formal educated than dalits and male than female. Thus, 48% of dalits female received formal education at school and this rate is around 76% for middle-upper caste male.

Significant differences through caste and gender are found in terms of occupation. One quarter of middle-upper caste male have agriculture as main occupation, more than three times higher than other groups (going to 16 times for dalits female). Self-employment is also over-represented for middle-upper caste male: while there are 20%, there only are 13% for dalits male, and last than 6% for female (dalits and non-dalits). Salaried job in agriculture appears as one of the major main occupation for dalits (37% for female and 26% for male) but not for non-dalits (17% for female and 7% for male). There is no important differences for salaried job in non-agricultural activity through the four groups (from 34% for non-dalits male to 44% for dalits male). A third of non-dalits female have unpaid work as main occupation –or they does not work at all, while they are less than 13% among middle-upper male, 10% among dalits male and 15% among dalits female. The significant differences between caste corroborate with data on labour income: On average, male have 102,000 INR per year as labour income, but the standard deviation is more than two times lower for non-dalits thus 50% of non-dalits have 67,000 INR per year while 50% of dalits have 45,000 INR. Non-dalits individual have more income generating occupation that allow members of household to not work. **literature** The conclusion is the same with data on multiple occupation. More than a half of dalits female (55%) have more than one occupation, while there are “only” 45% among middle-upper caste female. For male, more than a third of non-dalits have multiple occupation while they are 42% among dalits. Finally, on average, female have more than five times less than male in terms of labour income (around 20,000 INR per year for female and 102,000 INR for male).

Personality traits & cognitive skills in Figure 2 Figure 2 shows the distribution of each personality traits net of life-cycle. Middle-upper caste male tends to be more extraverted-opened than others (Factor 1). For Conscientiousness (Factor 2), male have significant higher score than women, whatever the caste (see Appendix B, Table 13). Dalits tend to be more emotional stable and conscientiousness (Factor 3) than non-dalits and dalits male more emotional stable than other (Factor 4). For Agreeableness (Factor 5), we do not find significant differences between our four groups (see Appendix B, Table 13). In terms of cognitive skills, male tends to have higher score.

Kernel: Epanechnikov;
Bandwidth: 0.32 for factors, 3 for raven, 1.5 for literacy, 1 for numeracy.

Figure 2: Distribution of cognitive skills and personality traits – The resulting cognitive score and personality trait is based on the standardised residual from univariate OLS regression with age as exogenous variable. This is the cognitive score and personality trait purged from life-cycle effects
Source: NEEMSIS (2016-17); author’s calculations.

Individual debt with Table 4 and 5 Dalits female are more indebted than others, but there is no statistical evidence: 79% of dalits female while 71% for others. Middle-upper caste male have highest total loan amount (124,440 INR that represent 1.21 years of labour income for the average dalit male), relatively similar for other groups (mean around 66,000 INR). But, the distribution is very different: median at 54 for dalits female, around 24 for dalits male and non-dalits female.

Number of loans

IDSR, share of income for principal and interest repayment can represent the burden of debt: double jeopardy for dalits female 185.87% on average and 44% for 50% of individuals while 4% for dalit male, 26% for middle-upper caste female and 4% for middle-upper caste male.

Female more over-indebted than male :

Table 5 shows correlation test between personality traits & cognitive skills and individual

indebtedness measures. For dalits, cognitive skills seems to be more correlated with debt than personality traits. Indeed, Numeracy appears as well negatively correlated with indebtedness measure for dalits, as Raven. Literacy seems to be positively correlated with individual debt for male while it is negatively correlated for female IDSR, whatever the caste.

Factor 1 –as Extraversion-Openness, is significantly positively correlated with individual debt service ratio for dalits female while, for dalits male, Factor 3 –as ESCO, is significantly negatively correlated with the probability of being in debt in 2020-21. For middle-upper caste female, Factor 1 is more correlated with the probability of being in debt than Raven test (respectively -0.18 and -0.13) Factor 1 to 4 are always negatively correlated with indebtedness measure for non-dalits female, going against cognitive skills for individual debt service ratio: Factor 3 and Factor 4 are negatively correlated while Raven, Numeracy and Literacy are positively correlated with the ratio.

Last, for non-dalits male, Factor 1 pulls debt in opposite directions depending on the measure used: it is positively correlated with loan amount and over-indebtedness (strongest relation with loan amount) and negatively correlated with the number of loans. **Peut-être car les gens très F1 ont peu de prêts mais des montants élevés, ça semble cohérent avec les hommes qui empruntent plus pour un besoin économique, donc besoin d'être EXOP alors que Femme petits prêts mais beaucoup : il n'y a que voir les montants avec les stat descriptives précédents**

Conclusion

Les programmes de MC qui essayent de cibler les plus pauvres ne sont pas super efficient car même chez eux, il y a beaucoup de situation différentes en termes de dette.

A Data description

In 2016-17, 492 households, 2,696 individuals, 953 egos.

But, 2 households without egos.

So we have 490 households and 953 egos. NEEMSIS2 (2020-21) recovered 485 households, 2,635 individuals.

But, 600+1 individuals have left their households between the two wave, whose 98 egos.

Which mean that we have 485 households and 2,034 individuals.

But, we always have our two households without egos in 2016-17 that we can not compare.

Thus, we have 483 households.

*But, for 10 households all egos have changed between 2016-17 and 2020-21. Egos of 2016-17 are still here in 2020-21, but **-due to technical issue?-** they do not be selected as egos.*

Finally, our sample is constitute from 835 egos represented 473 households.

B Factor analysis for personality traits

A.7: Factor 1 as Extraversion-Openness

Questions	Big-5 classification	N	Mean	SD	Corr.
Are you comfortable expressing your thoughts and opinions to others?	Extraversion	953	3.12	0.91	0.80
Do you like to think a lot, and reflect about ideas?	Openness	953	2.84	0.97	0.77
In social gatherings, do you like to talk to many people?	Extraversion	953	3.33	0.99	0.75
Do you have an active imagination?	Openness	953	2.78	0.93	0.73
Do you easily share your thoughts and feelings with other people?	Extraversion	953	3.20	1.04	0.73
Do you come up with original or new ideas?	Openness	953	2.69	0.94	0.68
Are you curious, interested in learning new things?	Openness	953	3.08	1.18	0.68
Are you inventive, and discover new ways of doing things?	Openness	953	2.77	1.02	0.63
Do you manage stress well?	Emotional stability	953	3.35	0.93	0.56
Are you talkative?	Extraversion	953	2.86	0.96	0.53
Do you try to understand how other people feel and think?	Agreeableness	953	2.91	1.03	0.48
Do you stay calm in tense or stressful situations?	Emotional stability	953	3.38	0.91	0.45
Are you shy with people?	Extraversion	953	3.39	0.87	0.31
Are you interested in nature, art or music?	Openness	953	3.13	1.10	0.31
Are you organized?	Conscientiousness	953	3.37	0.95	0.30
Are you helpful with others?	Agreeableness	953	2.76	0.94	0.30
Do you make plans and stick to them?	Conscientiousness	953	3.32	0.97	0.27
Are you enthusiastic and full of energy?	Extraversion	953	3.40	0.93	0.24
Do you work hard to do things well and on time?	Conscientiousness	953	3.48	0.84	0.17
Do you enjoy being with people?	Extraversion	953	4.12	0.86	0.13
Do you get to work and appointments on time?	Conscientiousness	953	3.43	0.84	0.12
Do you get easily upset?	Emotional stability	953	3.10	0.76	0.09
Do you have sudden changes in your mood?	Emotional stability	953	3.52	1.04	0.08
Do you worry a lot?	Emotional stability	953	3.05	0.75	0.02
Do you get nervous easily?	Emotional stability	953	3.30	0.87	0.01
Do you get easily distracted?	Conscientiousness	953	3.55	0.96	0.01
Do you put off your duties in order to relax?	Conscientiousness	953	3.53	1.01	0.01
Are you generally trusting of other people?	Agreeableness	953	3.25	0.83	-0.05
Do you work well with other people?	Agreeableness	953	3.97	0.86	-0.05
Do you tolerate faults in other people?	Agreeableness	953	2.95	0.71	-0.06
Do you prefer work that involves repetitive tasks and routines?	Openness	953	2.88	0.95	-0.08
Do you forgive other people easily?	Agreeableness	953	3.00	0.73	-0.10
Do you complete your duties on time?	Conscientiousness	953	3.27	0.83	-0.13
Do you tend to be rude to other people?	Agreeableness	953	4.62	0.82	-0.22
Do you feel sad, depressed?	Emotional stability	953	3.04	0.75	-0.23

Note: Most contributive variables (represented with **bold font**) are used to interpret factor.

A.8: Factor 2 as Conscientiousness

Questions	Big-5 classification	N	Mean	SD	Corr.
Do you complete your duties on time?	Conscientiousness	953	3.27	0.83	0.73
Do you get to work and appointments on time?	Conscientiousness	953	3.43	0.84	0.68
Are you enthusiastic and full of energy?	Extraversion	953	3.40	0.93	0.68
Do you make plans and stick to them?	Conscientiousness	953	3.32	0.97	0.60
Do you work hard to do things well and on time?	Conscientiousness	953	3.48	0.84	0.58
Do you work well with other people?	Agreeableness	953	3.97	0.86	0.57
Are you organized?	Conscientiousness	953	3.37	0.95	0.57
Do you put off your duties in order to relax?	Conscientiousness	953	3.53	1.01	0.40
Are you interested in nature, art or music?	Openness	953	3.13	1.10	0.37
Do you enjoy being with people?	Extraversion	953	4.12	0.86	0.36
Are you generally trusting of other people?	Agreeableness	953	3.25	0.83	0.34
Are you inventive, and discover new ways of doing things?	Openness	953	2.77	1.02	0.32
Do you come up with original or new ideas?	Openness	953	2.69	0.94	0.28
Are you curious, interested in learning new things?	Openness	953	3.08	1.18	0.27
Do you tend to be rude to other people?	Agreeableness	953	4.62	0.82	0.26
Do you forgive other people easily?	Agreeableness	953	3.00	0.73	0.22
Do you feel sad, depressed?	Emotional stability	953	3.04	0.75	0.20
Do you have an active imagination?	Openness	953	2.78	0.93	0.19
Do you tolerate faults in other people?	Agreeableness	953	2.95	0.71	0.17
Do you get easily distracted?	Conscientiousness	953	3.55	0.96	0.16
Do you worry a lot?	Emotional stability	953	3.05	0.75	0.16
Do you like to think a lot, and reflect about ideas?	Openness	953	2.84	0.97	0.14
Do you have sudden changes in your mood?	Emotional stability	953	3.52	1.04	0.08
Are you helpful with others?	Agreeableness	953	2.76	0.94	0.07
Do you easily share your thoughts and feelings with other people?	Extraversion	953	3.20	1.04	0.06
Do you manage stress well?	Emotional stability	953	3.35	0.93	0.04
Do you get nervous easily?	Emotional stability	953	3.30	0.87	0.00
Do you try to understand how other people feel and think?	Agreeableness	953	2.91	1.03	-0.03
Do you get easily upset?	Emotional stability	953	3.10	0.76	-0.05
Do you stay calm in tense or stressful situations?	Emotional stability	953	3.38	0.91	-0.09
Are you comfortable expressing your thoughts and opinions to others?	Extraversion	953	3.12	0.91	-0.12
Are you talkative?	Extraversion	953	2.86	0.96	-0.16
In social gatherings, do you like to talk to many people?	Extraversion	953	3.33	0.99	-0.18
Are you shy with people?	Extraversion	953	3.39	0.87	-0.20
Do you prefer work that involves repetitive tasks and routines?	Openness	953	2.88	0.95	-0.48

Note: Most contributive variables (represented with **bold font**) are used to interpret factor.

<i>Between groups</i>	107.53	3	35.84	11.59	0.00	2.63	0.45
<i>Within groups</i>	2,558.20	827	3.09				

Note: * Bartlett's test. Although there is much debate, we admit that when the sample size is similar, ANOVA is robust to difference in variance between groups (Box, 1954).
